Challenge

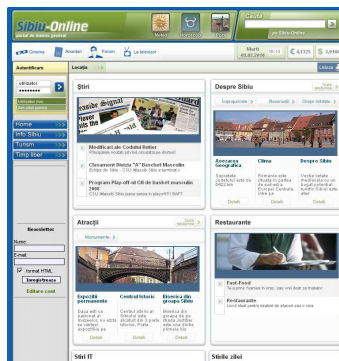

Sibiu is a medieval city situated in the centre of Romania. Its tourism and economic potential inspired Ropardo S.R.L. to start promoting the values of this city through Internet. The Internet portal Sibiu-online, set up in 2004, has started from the necessity to offer to Internet users from Sibiu and from the entire country up-to-date information about locations, useful addresses, commercial centers, services, sightseeing spots and news they might need. The portal wants to become a guiding mark as well for the citizens and for the tourists.

The project has as a main purpose to provide free services for online visitors, from Sibiu or the entire country and especially from abroad. The portal addresses to everybody interested about historical data and general information about the city, as well as up-to-date information, locations or news.

As the portal is designed to offer free services, an important element to be taken into account was the reliability from the point of view of cost of the entire development process. The portal had to be easy to maintain, update, and need no special hardware or special training for the non-technical personnel. The portal had to be found attractive for a large target-group and to rest easy to access even for weak connections.

Solution

Ropardo S.R.L. considered this situation a long-term self-challenge, of positive results for our teams expertise and for future projects. After a searching and testing period for many open source solutions, the problem related to project development was outrun by the fact that the chosen solution delivered much of the functionalities desired and the solid structure for developing supplementary functionalities in an efficient manner from the cost point of view. This solution is designed and realized so that to allow to the site administrator to modify the information displayed in real time with minimum effort.

We select for implementation of portal TYPO3 as CMS and we developed new extension for different services that was desired for portal.

Technologies on short

The following technologies were used:

Php, MySQL, Typo3, Linux, Typo3 Extension framework, HTML, CSS

In order to realize such a portal / that kind of a portal a flexible solution is needed. This must allow to a large number of visitors to consult the online pages in a most simple manner. For the site administrator, solution must allow to manage efficiently the information published on the site. Also, the configuration of the exterior aspect of the portal imposed as a necessity finding an adequate solution for an interactive and dynamic site. In order to accomplish all the demands and criteria shown above, which we had to take into account when designing our portal, we chose a Content Management solution.

This solution provides many advantages: speed, facility to use as well for the administrators and for the one who is not familiar to the system. All of these obtained with a minimum effort and reduced cost.

By accessing this portal the users have the possibility to benefit of first-class information, diverse, continuous updated, covering a series of domains, useful as well for the inhabitants of the city and for the tourists.

Nearshore Benefits:

- Quality Custom Software Development
- End User Satisfaction
- Short time to market
- Quantifiable Value
- Guaranteed performance

level

- Predictable cost
- Based on our specific business model we deliver high value at a good price.
- Flexibility
